

## Double-Wall SPOT Flanges™

SPOT Flanges™ are an economical option for joining double-wall round and flat oval spiral pipe and fittings where the size or an installer preference requires a flanged connection. They are roll-formed from 18-gauge galvanized material, then factory mounted on our spiral pipe and fittings by spot-welding and sealing. A secondary metal nosing is inserted into the inner shell, bridging the gap between the inner and outer shell while isolating the insulation from the airstream. Field connections are made using neoprene gaskets or butyl tape (by others) placed between flanges, then screwed together on 6-inch centers.

Optional materials are available. Please contact the nearest Spiral Pipe of Texas representative for more information.
